

Current Magazine Release Standards for MRI-Simmons USA Survey of the American Consumer

Last Revised June 2022

Release means included among data available by service bureau, MEMRI or Insights.

- 1a.** A magazine with an unweighted reader count of 145 or more in the measurement period will be released as an individual title in MRI-Simmons USA's Fall or Spring releases. A magazine with an unweighted reader count between 115 and 145 in the measurement period will be released as an individual title in MRI-Simmons USA's Fall or Spring releases, **unless it has a relative two-sigma sampling error of more than 35% for two consecutive Spring or Fall releases.** Magazines appearing in hard-copy printed volumes or readers-per-copy card are restricted by space limitations only.
- 1b.** For Summer or Winter reports, magazines will not be newly reported; however, we will apply minimum standards for review of magazines previously released.
- 2a.** (For magazines released in the Spring or Fall reports) Any magazine released in the successive Spring reports automatically qualifies for release in the Doublebase study.
- 2b.** (For magazines not yet released in a Spring or Fall report) A magazine may be released in a Doublebase report without yet qualifying for release in either the Fall or Spring reports. This qualification requires a minimum in-tab of 225 respondents, with no fewer than 100 unweighted readers in each of the two years of measurement. **The relative two-sigma sampling error must also not exceed 25%.** A magazine can only be released if MRI-Simmons USA evaluation of the data does not suggest the need for additional measurement before release. MRI-Simmons USA evaluation considers the homogeneity of the audience, the variation of the sample weights and stability from year to year. This evaluation ensures that the newly measured magazine has demonstrated a reliable estimate of its profile over the two years of measurement. Each year's profile is based on two waves of data.

The release of a magazine in a Doublebase report does not automatically qualify the magazine for release in either the subsequent Fall or Spring report.

- 3.** No newly measured magazine will be released for the first wave. MRI-Simmons USA will release a newly measured magazine after two waves of measurement if:
 - a)** The magazine meets standard #1.
 - b)** MRI-Simmons USA's evaluation of the data does not suggest the need for additional measurement before release. MRI-Simmons USA's evaluation considers the homogeneity of the audience, the variation of the sample weights and stability from wave to wave. This evaluation ensures that the newly measured magazine has demonstrated a reliable estimate of its profile over at least two waves. MRI-Simmons

USA also considers the unweighted count of readers for the two waves in its evaluation.

This standard applies to all previously measured magazines that had fallen substantially below report/release standards for at least one year.

MRI-Simmons USA evaluates newly measured magazines for release in the Doublebase employing the above criteria over the four waves in the study.

4a. Magazines whose audited circulation (paper/printed edition) is less than 85,000 in the Fall or Spring Reports and less than 60,000 in the Doublebase are not eligible for release.

4b. A magazine whose audited circulation (paper/printed edition) does not meet the minimum circulation standards in 4a., but the combined print and digital audited circulation is 95,000 or greater may be eligible for Print+Digital NET readership estimate release, if other release standards are met. Readers per copy will not be calculated for these publications.

If a magazine has once been released, then subsequently falls marginally below the requirements of standards #1, 2b and/or #4, the magazine may continue to be released for up to three subsequent reports, subject to MRI-Simmons USA's evaluation of data.

- 5.** Magazines of a specialist or "vertical" nature that are sold as members of a group may or may not be reported in hard copy, by agreement between MRI-Simmons USA and the publisher. However, these magazines will be released if they meet the abovementioned standards for the appropriate report. Exception: Data for individual members of trade/professional networks will not be released.
- 6.** A magazine that, **in MRI-Simmons USA's judgment**, undergoes a radical change, including but not restricted to change of name, publication frequency, circulation or editorial approach, may be suspended from release for no more than two waves. After the two waves, MRI-Simmons USA will evaluate these magazines using the same standards established for newly measured magazines.
- 7.** Magazines that are currently not audited, have been temporarily suspended (TSS) by ABC or BPA or terminated the audit process with ABC or BPA may be released, but will be noted as such.
- 8.** Magazines that require measurement changes, such as variant publication intervals, may require two waves of evaluation by MRI-Simmons USA before release.

Magazines that do not or cease to carry advertising may, **at MRI-Simmons USA's discretion**, not be reported on hard copy.
